## PREVIOUS SERIES 94 BULLETINS

Bulletin 94 series is being published by the Department of Water Resources for the information and use of all interested agencies and the general public. Earlier bulletins in this series are:

Bulletin No. 94-1, "Land and Water Use in Tule River Hydrographic Unit".

Bulletin No. 94-2, "Land and Water Use in Trinity River Hydrographic Unit".

Bulletin No. 94-3, "Land and Water Use in Yuba-Bear Rivers Hydrographic Unit".

Bulletin No. 94-4, "Land and Water Use in Smith River Hydrographic Unit".

Bulletin No. 94-5, "Land and Water Use in Shasta-Scott Valleys Hydrographic Unit". (Preliminary Edition)

Bulletin No. 94-6, "Land and Water Use in Klamath River Hydrographic Unit".

Bulletin No. 94-7, "Land and Water Use in Mad River-Redwood Creek Hydrographic Unit".

Bulletin No. 94-8, "Land and Water Use in Eel River Hydrographic Unit". (Preliminary Edition)

Bulletin No. 94-10, "Land and Water Use in Mendocino Coast Hydrographic Unit". (Preliminary Edition)

Bulletin No. 94-11, "Land and Water Use in Russian River Hydrographic Unit". (Preliminary Edition)

Bulletin No. 94-12, "Land and Water Use in Sacramento Valley West Hydrographic Unit". (Preliminary Edition)

Bulletin No. 94-13, "Land and Water Use in Putah-Cache Creeks Hydrographic Unit". (Preliminary Edition)

Bulletin No. 94-14, "Land and Water Use in American River Hydrographic Unit". (Preliminary Edition)

## FOREWORD

In 1956, the State Legislature declared:

"... that in providing for the full development and utilization of the water resources of this State it is necessary to obtain for consideration by the Legislature and the people, information as to the water which can be made available for exportation from the watersheds in which it originates without depriving those watersheds of water necessary for beneficial use therein ..."

The Department of Water Resources was therefore directed to conduct the necessary investigations to compile this information.

For purposes of these studies, the State was divided into major hydrologic areas which, in turn, were subdivided into hydrographic units, generally comprising watersheds of individual rivers. Basic data on water use, land use, land classification, streamflows, ground water, and water quality are being collected by hydrographic units throughout the State. The collection and processing of these data and the publication of the results, for use by the Legislature and all others concerned, are being accomplished in two phases.

The first phase is concerned with the land and water use and land classification data. Reports of the Bulletin No. 94 series present these data for individual hydrographic units before the other studies are completed for the same areas. Following collection and processing of this material, these bulletins are distributed in preliminary form and reviewed at public hearings. Final editions are then published including summaries of the hearings and resulting revisions. These bulletins are an essential source of data for the subsequent water requirements studies, and when complete, will provide detailed data for the entire State.

This land and water use report is the thirteenth of the series to be published in the first phase of the investigations. It is the final edition of Bulletin No. 94-13 following public hearings held in the Putah-Cache Creeks area in January 1965.

The second phase begins with an inventory of water resources in each area, including streamflows, ground water, and water quality characteristics. Estimates of future water requirements to be based on the land and water use studies and projections of foreseeable future development, are also being made. Results of these water resources and water requirements studies will be published in the second series of reports. These will be designated the Bulletin No. 142 series, and generally cover groups of hydrographic units.

These water resources and future water requirements bulletins will provide the basis for outlining the additional projects

needed to meet the State's growing water needs. By interrelating the projected water requirements of all areas of the State with the available local supplies, by decades, a recommended sequence and timing for the State's future water development plans will be established. Besides thus forming the chief basis for the Department of Water Resources' all important project staging program, the data on water resources and water requirements will be a most valuable guide for water development planning by federal and local, as well as state agencies.

The Department of Water Resources gratefully acknowledges information contributed by the numerous water users and residents of the Putah-Cache Creeks Hydrographic Unit and various agencies of the federal, state, and local governments.

## DEPARTMENT OF WATER RESOURCES

P.O. BOX 388  
SACRAMENTO

March 23, 1965

Honorable Edmund G. Brown, Governor  
and Members of the Legislature  
of the State of California

Gentlemen:

I have the honor to transmit Bulletin No. 94-13, entitled "Land and Water Use in Putah-Cache Creeks Hydrographic Unit", the thirteenth of a series of reports of the Department of Water Resources, which present detailed basic data of land use, classification of land, water use, and apparent water rights within certain hydrographic units of the State. These studies are being conducted pursuant to legislation sponsored by former Senator Edwin J. Regan and codified under Section 232 of the Water Code.

The preliminary edition of this bulletin was published in April 1964 and was subsequently distributed for review. In January 1965, the Department of Water Resources held public hearings to receive comments from interested individuals and agencies of findings set forth in the bulletin. After consideration of these comments, necessary revisions were made.

The information contained in this series of reports will provide a basis for future estimates of the amount of water which originates within each watershed, the amount which can be used beneficially within each area, and the amount of surplus or deficiency if any. The completed series will provide invaluable reference material relating our water resources to land classification and use.

The data presented in this bulletin will help concerned interests determine how best to develop and use the water resources of the Putah-Cache Creeks Hydrographic Unit. The bulletin discusses history, natural features, climate, and economy of the unit. Maps of present land use and classification of lands illustrate the text.

Sincerely yours,

A handwritten signature in cursive script, reading "William E. Warne".

PUBLIC HEARING  
on  
Preliminary Edition  
of  
Bulletin No. 94-13,  
"Land and Water Use in Putah-Cache Creeks Hydrographic Unit"

In accordance with Section 232 of the Water Code, the State Department of Water Resources held public hearings on January 14, 1965, in Pope Valley, California, and January 21, 1965, in Kelseyville, California, to receive comments from agencies, groups, and local interests on the preliminary edition of Bulletin No. 94-13, "Land and Water Use in Putah-Cache Creeks Hydrographic Unit". The hearings were attended by about 70 persons, including local people, and representatives from federal, state and local governmental agencies.

After consideration of both verbal and written comments, it was concluded by the department that many suggested revisions be incorporated in the bulletin before final publication.

Transcripts of the January 14 and 21, 1965, public hearings and copies of the department's response to written comments, are on file with the Department of Water Resources in Sacramento and are available for review by the public.

Verbal comments were made at the January 14, 1965 hearing by the following persons:

Mr. C. F. Alexander, 3645 Dartmouth Drive, Napa, California  
Mr. N. R. Blanchard, Director, Pope Valley Farm Center,  
Pope Valley, California  
Mrs. Joan Burns, Pope Valley, California  
Mr. Joseph E. Carson, United States Bureau of Reclamation,  
1010 West Salvador Avenue, Napa, California  
Mr. Joseph Ely, United States Mendocino National Forest  
Mr. Robert J. LaRue, Coordinator, Napa County, Napa,  
California  
Mrs. Southall R. Pfund, Box 26, Pope Valley, California  
Mrs. Delia A. Swift, Chiles Star Route, St. Helena, California

Verbal comments were made at the January 21, 1965, hearing  
by the following persons:

Mr. Joseph E. Carson, United States Bureau of Reclamation,  
1010 West Salvador Avenue, Napa, California  
Mr. David J. Cox, Lake County Water Commission, Kelseyville,  
California  
Mr. Willard D. Hansen, Manager, Lake County Flood Control  
and Water Conservation District, Lakeport, California  
Mr. Frank Hartman, P. O. Box 152, Middletown, California

Written comments were received from the following:

Mrs. Leonora Bennett Luntsford, 1143 Mound Street, Alameda,  
California  
Mr. Harry Mortensen, President, East Lake Soil Conservation  
District, Middletown, California  
Honorable DeWitt Nelson, Director, Department of Conservation,  
State of California, Sacramento, California

## CHAPTER I. INTRODUCTION

This bulletin presents basic data on land and water use in the Putah-Cache Creeks Hydrographic Unit. These data cover present land and water use, classification of lands, systems used to divert surface water, histories of diversions, apparent water rights pertinent to each diversion, purpose and extent of use of diversions, seasonal quantities of water diverted during 1960, and an estimate of present consumptive use of water in the unit. A general description and a brief history of the area are also included.

These basic data were gathered during the period 1959-61 in compliance with Chapter 61, Statutes of 1956, as amended by Chapter 2025, Statutes of 1959, and codified in Section 232 of the Water Code of the State of California. This legislation provides for an inventory of water resources and water requirements of the State. This is the thirteenth in a series of bulletins being prepared under this authorization. The text of Section 232, with a discussion of its history and implications, is included in this bulletin as Appendix A.

Data presented in this bulletin will provide the basis for a future determination of the quantities of water reasonably required for future beneficial use within the Putah-Cache Creeks Hydrographic Unit. Preliminary estimates of water use and related information were published in the following: State Water Resources Board Bulletin No. 14, "Lake County Investigation," July 1957; and Department of Water Resources Bulletins: No. 20, "Interim Report Cache Creek Investigation," April 1958; No. 58, "Northeastern Counties Investigation," June 1960; No. 90, "Clear Lake-Cache Creek Basin Investigation," March 1961; and No. 99, "Reconnaissance Report on Upper Putah Creek Investigation," March 1962. The final determination of the water requirements will be based on estimates of future: (1) land use, (2) economic patterns, (3) population, (4) industrial and agricultural development, and (5) recreational needs.

The data presented herein have been reviewed in preliminary form by the local water users. The changes submitted by the local water users were reviewed in the field and adjustments have been made where warranted.

### Organization of Report

This bulletin consists of five chapters, four appendices, and three plates. Chapter I contains a general description and brief history of the Putah-Cache Creeks Hydrographic Unit. Chapter II presents data on present uses of water and includes information pertaining to surface water diversion systems, water rights, quantities of water diverted, and consumptive use. Chapter III includes a history of the land use and a tabulation of present land use. Chapter IV includes a tabulation of lands classified with regard to their potential for irrigated agriculture and for recreational purposes. Chapter V summarizes the data presented in the bulletin.

Appendix "A" presents the text of Section 232 of the California Water Code and a discussion of the pertinent responsibilities and work program of the Department of Water Resources. Appendix "B" lists related investigations and other references used in the preparation of this report. Appendix "C" contains a short summary of California water law and a tabulation of applications to appropriate water in the Putah-Cache unit as filed with State Water Rights Board. Appendix "D" presents the text of two court decrees pertinent to water use in the Hydrographic Unit.

Plate 1 is a map showing the general location of the Putah-Cache Creeks Hydrographic Unit, the subunits, and the selected climatological stations. Areas of present land uses and the location of diversion systems are shown on Plate 2. The classification of lands is shown on Plate 3.

### General Description of Area

The Putah-Cache Creeks Hydrographic Unit lies within the Coast Range, about 70 miles north of San Francisco Bay, and encompasses most of Lake County, part of Napa County, and small portions of Colusa, Mendocino, and Yolo Counties as shown on Plate 1, "Location of Unit." The northern half of the unit contains the Clear Lake-Upper Cache Creek Basin watershed and occupies 809 square miles of Lake County, 103 square miles of Colusa County, 35 square miles of Yolo County, and 3 square miles of Mendocino County. The southern portion contains the upper watershed of Putah Creek and occupies 207 square miles of Lake County and 362 square miles of Napa County. The unit is bounded by the Eel River and Stony Creek watersheds on the north, and by the Russian and Napa Rivers watersheds on the west and south and by the Sacramento Valley Floor on the east.

The Clear Lake Basin and Cache Creek watersheds drain approximately 950 square miles in the northern half of the unit. Clear Lake, located approximately in the center of Lake County, is fed primarily by Kelsey Creek from the south and Scotts Creek and Middle Creek from the north. Cache Creek originates at the southern outlet of Clear Lake and flows in an easterly direction through a mountainous area to its confluence with the North Fork of Cache Creek, approximately 8.0 miles below Lower Lake, and with Bear Creek, about 6.0 miles above Rumsey. These are the two major tributaries of Cache Creek.

The Putah Creek drainage area (about 569 square miles) lies within the northern portion of Napa County and the southern portion of Lake County. It is a generally mountainous area, about 20 miles wide at the widest point and extends about 50 miles in a northwest to southeast direction. Putah Creek flows in a southeasterly direction from its headwaters near Whispering Pines to

Monticello Dam near Winters where it leaves the unit. The major tributaries of Putah Creek are Etecuera, Hunting, Soda, St. Helena, Butte, and Pope Creeks.

For purposes of this report, the Putah-Cache Creeks Hydrographic Unit has been divided into nine subunits shown on Plate 1, "Locations of Unit." The areas of these subunits are shown in Table 1.

#### Historical and Present Development

Hunters and trappers of the Russo-American Fur Company were the first known white men to inhabit the Putah-Cache Creeks area. They were attracted as early as 1811 by the wild game that abounded near Clear Lake.

After the Indians of the Pomo tribe who inhabited the area at that time had been established on reservations, the population of settlers steadily increased, and farming of the fertile valleys became the major factor in developing the unit.

Among the first settlers in the unit were William Pope and Jose Berryessa. Both men obtained large grants of land from the Spanish Territorial Government in 1841. William Pope was granted the Rancho Locoallomi, currently referred to as Pope Valley, and Jose and Sista Berryessa were granted the Los Putas Rancho, later known as Berryessa Valley, which today is inundated by Lake Berryessa.

As settlement in Berryessa Valley increased after 1843, agriculture became more intensified with wheat, hay, barley and corn growing well. Fruit crops were not successful because of the late spring frosts. Today, most of the land in the Upper Putah Creek watershed is utilized in the production of mixed hay, pasture, and grain. The cattle industry, currently the major industry of the Upper Putah watershed, was introduced in 1857 when John Smittle brought 200 head of cattle into Berryessa Valley.

In the early 1840's, Salvador Vallejo settled much of what is now known as Big Valley. He was followed by Stone and Kelsey who ran cattle in Big Valley until they were killed by Indians in 1849. Further settlement did not take place until 1854 when Robert Gody settled near the site of the Stone-Kelsey cabin near the present community of Kelseyville. Settlers were soon arriving in number and it was not long until the valley portions of the unit were in private ownership.

Main Street,  
City of Lakeport

Haying Operation  
in  
Big Valley

Early agricultural activity in Lake County was centered around the raising of cattle and hogs in several of the valleys near Clear Lake. Land under cultivation in Lake County increased from 9,000 acres in 1868 to almost 15,000 acres in 1880 with most of the acreage being planted in wheat. Through the years the agricultural pattern changed considerably. By 1960, 21,090 acres of the 39,620 acres under cultivation in the Lake County area were planted to deciduous orchard of which 13,920 acres were devoted to nut trees. Although the climate and soils appear to present an excellent potential for grape production in Lake County, a relatively insignificant 140 acres of grapes were in production in 1960.

The population growth in the unit has been relatively slow; in 1900 it was about 7,700 and in 1960, it was estimated at 14,200 an annual average increase of only 1.4 percent. This rate should increase greatly in the future with the ever increasing need for development of new recreational facilities.

The main population centers in the unit lie within Lake County. Lakeport, the only incorporated city in the unit, is the county seat of Lake County with a 1960 population of 2,303. Other urban centers and their 1960 populations are: Middletown, 450; Kelseyville, 500; Upper Lake and vicinity, 600; and the remaining periphery of Clear Lake, approximately 3,000. Although there are other areas of population, they are small and do not effectively indicate urban potential. The southern portion of the unit, except for the Middletown area, is presently sparsely settled.

Mineral production, an important industry in the early history of the unit, began when mercury was first discovered west of Lakeport in the Mayacmas Mountains about 1860. The total production of mercury between 1869 and 1880

Picking Pears  
Near Finley

California Fruit  
Growers Associa-  
tion Packing  
Shed at Finley

Cinnebar Mine

Walnut Orchards  
on Mt. Konocti

was about 5 million pounds. Following this peak, mercury production declined in importance in the unit except for brief periods during World War I and World War II when higher prices made mining profitable. Other minerals produced within the unit include: asbestos, diatomite, gem stone, crude perlite, volcanic cinders, sand and gravel, manganese, pumice, sulphur ore, and small amounts of silver. The major contribution to the mineral wealth is the production of crushed stone, sand, and gravel, most of which is produced in the Lake County portion of the unit near Clear Lake Highlands, Clear Lake Oaks, Kelseyville, and Lakeport. Over 388,000 short tons of sand and gravel and over 11,000 short tons of crushed stone were produced in 1961. Mineral production, although declining in statewide importance, has continued to be of importance to the local economy. In 1961, the production of sand and gravel was valued at \$384,000, and the production of mercury, pumice, volcanic cinders, and sulphur ore was valued at \$189,000.

The timber industry can be compared to that of the mineral industry in that it stimulated the early development of the area. After 1873 its importance declined due primarily to the decline in the demand for shoring timber used in the mines. Some lumbering activity took place prior to the turn of the century in the Howell Mountains, near St. Helena, but the supply of adequate timber resources dwindled rapidly, curtailing activity. In 1868 approximately 1,700,000 board-feet of lumber was cut and this was doubled by 1873; but by 1880, output had declined to about 1,000,000 board-feet. Presently, the only logging in the unit is a negligible amount in Mendocino National Forest.

Recreation and its related activities are a major factor in the growth and progress of the Putah-Cache Creeks Hydrographic Unit. Early authors wrote in glowing terms about the "beautiful streams of water that gush forth and find

Hobergs Resort  
on  
Cobb Mountain

Seigler Springs  
Resort on Cobb  
Mountain

their way to the nearest brooklet." <sup>1/</sup> In both Napa and Lake County, small resorts located near mineral springs became popular as convalescent spots for people of the Bay Area and the Sacramento Valley. A resort was established at Harbin Springs near Middletown as early as 1852. Aetna Springs, north of Pope Valley, was used as a resort in the 1870's with a peak of popularity in 1878, and Walter Springs, in the hills above Pope Valley, provided camping facilities and cottages for visitors as early as 1871. Today, changing customs and the completion of Monticello Dam have made water sports, fishing, and hunting a major attraction to the unit.

Presently, three distinct areas of recreational activity are evident in the unit. These are Cache Creek Basin in the center of Lake County; Cobb Mountain resort areas in the west central section of the unit; and Lake Berryessa at the southern end of the unit in Napa County.

The development of water-associated recreation in the Cache Creek Basin, which includes Clear Lake and the Blue Lakes, is indicated by the resorts, homes, and public parks that are found in the area, especially on the shorelines of the two lakes. The principal activities are swimming, boating, water skiing, and fishing for black bass, crappie, and catfish. Water-associated recreation in the Cache Creek Basin is a seasonal activity with a peak use during the major vacation period, July, August, and the early part of September. Wilsey and Ham, in a study of the Cache Creek Basin in 1958, estimated the number of user days of water-associated recreation around Clear Lake at 2,305,000 and gross expenditures by recreationists in the area of over 15 million dollars. Although these figures may be slightly overstated, they nevertheless indicate the importance of recreation to the economy of the unit.

Putah Creek

Future Camp Site  
on West Side of  
Lake Berryessa

Most of the resort areas on Cobb Mountain were established before the turn of the century and continue to attract a considerable number of visitors during the summer months, June through September. The actual number of visitor-days of use of the mountain resorts is not available. The Cobb Mountain area, considered to be a year-round resort with a large tract of summer homes, is located in a mountainous region of relatively heavy timber growth. The resorts generally consist of a large lodge with numerous surrounding cabins and feature golf courses, hiking, horseback riding, swimming, and other outdoor recreational activities.

Lake Berryessa, created by the construction of Monticello Dam and the consequent inundation of Berryessa Valley in 1957, is situated at the lower end of the unit west of the Vaca Mountains. The maximum surface area of the lake is over 22,000 acres, however, the average surface area is about 19,000 acres. Approximately 2,000 acres of the land surrounding the lake are classified as recreational. As of 1960, there were 7 developed campgrounds with about 700 tent spaces, 460 trailer spaces, and 2 picnic areas distributed along the lake shore. Nine privately owned boat launching ramps were in service by 1960. The Bureau of Reclamation estimated the use of Lake Berryessa at 500,000 visitor-days in 1958 and at 941,000 visitor-days in 1961.

The recreation associated with Clear Lake and Cobb Mountain resort areas in Lake County and Lake Berryessa in Napa County has had a distinct effect upon the economy of the unit. The potential for continued recreational development is excellent and it will have even greater economic impact in years to come.

Transportation in the unit is limited to county and state highways. These are relatively well-maintained, hard-surfaced roads which generally provide two lane, medium duty service. There are about 650 miles of county road and

150 miles of state highways in the unit. State Routes 20, 29, and 37 provide access from the Redwood Highway on the west and the Bay Area on the south. State Routes 128, 20 and 16 provide access from the Sacramento Valley area.

There is no rail service to the unit. Airport facilities consist of three, county-operated, privately-owned airfields located near Kelseyville, Lower Lake, and Hobert Springs and several small, privately-owned air strips.

### Soils

A wide variety of soils formed by the decomposition of various parent rock and modified by wide variations in climate and topography exists within the Putah-Cache Creeks Hydrographic Unit. These soils can best be segregated on the basis of their present and probable future utilization into three major soil or land use groupings: (1) the agricultural soils in and surrounding the various valleys, (2) the forested timber soils, and (3) the shallow upland range grazing soils.

The major agricultural soil bodies lie adjacent to the shores of Clear Lake and in the smaller valleys widely scattered throughout the hydrographic unit. Many acres of fine-textured basin soils were formed by the aggradation of Clear Lake. These dark colored basin soils are high in organic matter, fertile, and produce a wide variety of crops. They are particularly favored by orchardists for the production of irrigated pears and walnuts in the vicinity of Upper Lake and Kelseyville. The recent alluvial soils typified by deep, permeable profiles are found adjacent to the many creeks that transect the valleys of the region. Like the basin soils, the recent alluvial soils though limited in acreage, are highly prized for fruit and nut crop production. The older terrace alluvial soils were differentiated from the recent alluvial soils because they possess dense subsoil clay or hardpan layers that seriously

inhibit the penetration of both water and plant roots. The residual or upland agricultural soils are rather fertile, highly permeable, well-drained, and generally red in color but tend to vary widely in depth. These soils generally have the least agricultural value, and to date have not been extensively developed.

The second major grouping of soils are those best suited to forest management and recreational use. These soils are generally very red in color, occur in zones high in rainfall and have a dense vegetative cover composed of mixed conifers, madrone, and oaks.

The third grouping, the shallow upland range and grazing soils, are soils which generally occur in the more arid eastern portions of the hydrographic unit. These soils are characteristically shallow in depth and occur on steep broken terrain. They are frequently brush-covered but where brush control practices have been employed, they produce a fairly good annual winter-spring grass cover suitable for sheep or cattle grazing. Even though some of these soils could be considered as irrigable, their isolated position and small parcel size preclude development for irrigated agriculture.

### Natural Features

The Putah-Cache Creeks Hydrographic Unit covers an area of 1,519 square miles within Colusa, Lake, Mendocino, Napa, and Yolo Counties in the west central portion of the State. The unit is generally mountainous, varying in elevation from the water surface of Lake Berryessa, 440 feet at the spillway crest, to over 5,000 feet along the Pacific Ridge dividing Lake and Colusa Counties.

The regional topography of the Coast Range is characterized by northwestward trending ridges and valleys. These landforms are an expression of the prevailing geologic structure, the major faults and folds of which have a

northwest-southeast orientation. This topographic pattern is most obvious in the Cache Creek area but is more subdued in the Putah Creek area.

The entire Putah-Cache Creeks Hydrographic Unit is underlain by Jurassic and Cretaceous marine sediments, volcanics, and serpentine upon which, in places, continental sediments of the Cache formation and alluvium have been deposited. The ancient sediments were deposited in seas that occupied the region at various times during the Jurassic and Cretaceous periods and have undergone a long history of consolidation, deformation, and, in part, mild metamorphism. These formations have an aggregate stratigraphic thickness on the order of 30,000 feet.

The Jura-Cretaceous rocks are divided into four major geologic groups listed in order from oldest to youngest:

- (1) Franciscan group
- (2) Knoxville group
- (3) Shasta group
- (4) Chico group

The Franciscan group is characterized by hard, dark sandstone (gray-wacke), but it also includes moderate proportions of other rock types such as shale, chert, conglomerate, limestone, basalt, greenstone (metamorphosed volcanics), and serpentine. Serpentine is especially prevalent in the Upper Putah Creek Basin where it constitutes approximately one-fourth of the total surface area. Landslides are very common in the Franciscan, particularly in the serpentine. Zones of shearing and hydrothermal alterations are numerous in the Franciscan, so that a considerable part of it is sheared or contorted and contains zones of schist. Mineral products derived from the Franciscan include sand and gravel, decorative stone, stone riprap, quicksilver, magnesite, and chromite.

The Knoxville group consists primarily of shale, which occurs in a ratio of about 4:1 to interbedded sandstone. Shearing of the beds is less common in the Knoxville than in the Franciscan group.

A thick succession of massive, yellowish-brown to gray, marine sandstone, and gray shale overlies the Knoxville group. These sediments belong to the Shasta and Chico groups of Cretaceous age. The sandstone is generally fine to medium-grained and occurs in beds as thick as 15 feet. Blue Ridge and Rocky Ridge, located in the southeastern portion of the unit, are formed largely of the steeply dipping beds of the Shasta and Chico groups.

Marine conditions existed in at least a portion of the region in the early part of the Tertiary period. However, the extent of these seas is not known because the only exposures of Tertiary marine sediments occur in a limited area in the general vicinity of Lower Lake. These sediments consist of sandstone, shale, and conglomerate and contain fossils of the Martinez (Paleocene) and Tejon (Eocene) age.

Volcanic eruptions played a prominent part in the later geological development of the region lying generally south of Clear Lake. Volcanic action began in the Pliocene epoch and continued sporadically until perhaps a few thousands of years ago. The volcanic deposits of the area are divisible into two major series known as the Sonoma volcanics and the Clear Lake volcanics. The Mayacmas Mountains east of Clear Lake consist largely of the Sonoma volcanics of Pliocene age. The younger Clear Lake volcanics are evident in prominent land forms south of Clear Lake, such as Mt. Konocti, Mt. Hannah, Seigler Mountain, and Roundtop Mountain.

The most conspicuous natural feature within the Putah-Cache Creeks Hydrographic Unit is Clear Lake. Although Clear Lake has the sizable surface area of about 62 square miles and a perimeter of about 70 miles, the basin it occupies was probably even more extensive in late Pliocene time. The Cache formation which extends eastward from Clear Lake about 10 miles and has a maximum thickness of 6,500 feet, represents the alluvial and lake sediments that

collected in the ancestral Pliocene basin. Geologic evidence suggests that this basin extended southward from Clear Lake and was drained to the east by Cache Creek and to the west into the Russian River by Cold Creek. During the emplacement of the Clear Lake volcanic series, a lava flow blocked the eastern drainage, diverting the entire basin drainage to the western stream. This was followed, probably a few thousand years ago, by a landslide that descended from the southern side of the western gorge effectively blocking the western outlet, causing water to rise high in the basin and overflow across a sag in the lava flow on the east. The overflowing stream then cut a trench across the lava flow, thus lowering the lake about 60 feet to its present level.

Recent alluvium occurs extensively in the lowlands of the Lakeport-Kelseyville area, in the larger valleys of the region, and as narrow sinuous deposits along streams and creeks. Where it is sufficiently thick, as in Collayomi Valley where its thickness is approximately 300 feet, the alluvium constitutes an important source of ground water.

### Climate

The climate of the Putah-Cache Creeks Hydrographic Unit is characterized by warm summers and mild winters. Over 95 percent of the annual precipitation occurs during the 7-month period, October through April, with the remainder distributed over May, June, and September. July and August are dry except in unusual years. Most of the precipitation occurs as rainfall although some snow may fall in the winter months at the higher elevations, but does not form a snow pack. Annual precipitation, influenced by the Coast Range on the west and Bartlett Mountain north of Clear Lake varies from about 20 inches in the Capay area to over 80 inches at the higher elevations west of Middletown.

Table 2 shows the mean annual precipitation adjusted to correspond to the 1911-1960 base period at selected stations within the Putah-Cache Creeks Hydrographic Unit. Location of the 14 selected stations are shown on Plate 1.

\* Arithmetic average adjusted for a base period of 1911-1960.

\*\* Broken record.

Temperatures in the unit are influenced by the prevailing air masses which generally cover the area. A marine air mass occupies the area in the winter and as a rule the amount of precipitation keeps the temperatures from dropping below 20 degrees. In the summer a continental tropical air mass prevails resulting in hot daytime temperatures with moderate cooling at night.

The average annual temperatures and average length of frost-free period for 7 representative stations are shown in Table 3 on page 22. The temperatures presented are the arithmetic averages of the daily minimum and maximum temperatures in degrees Fahrenheit, for the indicated period of record.

The length of frost-free periods shown in Table 3 represents the average period in days between the last day in spring and the first day in fall when the daily minimum temperature fell below 32 degrees Fahrenheit. Location of the 7 representative stations in Table 3 are shown on Plate 1.

### Water Resources

The water resources of the Putah-Cache Creeks Hydrographic Unit originate from the winter precipitation, occurring as ground water in the limited ground water basins and as surface runoff in the streams of the area. The surface runoff of the upper Cache Creek watershed enters Clear Lake where a substantial portion is stored for later use outside the unit. The runoff of Putah Creek flows into Lake Berryessa where it is stored for subsequent diversion out of the unit. Although Monticello Dam provides almost full control of Putah Creek, a large percentage of the flow of Cache Creek is unregulated and wastes from the unit, particularly during years of heavy precipitation.

Records of flow are available for a number of stream gaging stations in the Putah-Cache Creeks Hydrographic Unit. Records from four selected stations, which measure runoff from approximately 1,400 square miles, or 92 percent of the hydrographic unit are summarized in Table 4 on page 23.

(c) Zero flow, 7/25/60 and 8/20/60.

## CHAPTER II. WATER USE

Typical of the State of California in its history of water use, the Putah-Cache Creeks Hydrographic Unit has its history of investigations and proposals for water development dating from well before the turn of the century. At various times, there have been many proposals for the construction of reservoirs and utilization of lakes which were looked to as the key for firming water supplies both within and outside of the unit. One of the first studies conducted in the area was in the early 1870's when engineers examined Clear Lake as a possible source of domestic supply for the City of San Francisco. However, high evaporation losses resulted in abandonment of the idea.

The development of water in the unit for agriculture and water-associated recreation began prior to 1900. Although irrigation from both surface and ground water sources began before 1900, irrigation development did not become extensive until after the first World War. The earliest history of recreation was the establishment of a resort at Harbin Springs near Middletown in the mid 1850's and the sport fishing on Clear Lake, which is the largest natural lake entirely within the State.

The water use survey conducted for this report, results of which are discussed herein, was generally limited to the investigation of those individual uses of surface water exceeding 10 acre-feet per year. The survey developed information concerning: (1) location of the surface water diversion point, (2) description of the diversion system, (3) use of the diverted water, (4) amount of water diverted, and (5) the apparent water right under which the diversion was made.

Lake

### Present Water Use

The present water requirements for irrigated agriculture, municipal, industrial, domestic, and recreational uses, are supplied from both surface and ground water. There was 18,174 acres of irrigated lands in the unit during 1960; 6,797 acres were supplied with surface water, and 11,377 acres were irrigated with ground water. Of the 6,797 acres supplied with surface water, 1,050 acres received some supplemental irrigation from ground water. In 1960, there were approximately 22 water service agencies in the unit supplying water for municipal and domestic uses; 8 utilized surface water, and 14 depended on ground water for their supply. Other consumptive uses of surface and ground water include stockwatering, incidental fire protection, numerous individual domestic, minor industrial, and miscellaneous uses. In addition to these consumptive uses, an ever increasing use of the unit's water is being made by water-associated recreation. The two major water-associated recreational areas are the Clear Lake Basin, including Clear Lake and the Blue Lakes, and Lake Berryessa.

Consumptive use of water is defined as water consumed by vegetation for transpiration and building of plant tissue, plus the water evaporated from adjacent soil and water surfaces. Based on the unit consumptive use values given in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements, State of California," and Department of Water Resources Bulletin No. 14, "Lake County Investigation," the consumptive use of applied water for irrigated agriculture during 1960, is estimated to have been 24,559 acre-feet in the Cache Creek basin and 5,367 acre-feet in the Putah Creek basin.

Pasture	2.3	2.3
Orchard	1.3	1.3
Field	0.9	0.7
Truck	0.8	0.7

Values from Bulletins Nos. 2 and 14.

The consumptive use of water for other purposes such as domestic, municipal, industrial, mining, etc. was not evaluated for this unit. One of the major losses of water in the unit is the annual evaporation from the surfaces of Clear Lake and Lake Berryessa. This is estimated to be 74,000 acre-feet annually for Lake Berryessa <sup>3/</sup> and to range from 139,000 acre-feet <sup>1/</sup> to 220,000 acre-feet <sup>2/</sup> annually for Clear Lake.

A total of 271 diversions of surface water were located in the unit in 1960. These are classified by primary use as follows:

<u>Primary Use</u>	<u>Number of diversions</u>
Irrigation	205
Stockwatering	24
Domestic	20
Municipal	10
Recreation	7
Industrial	3
Mining	2

Points of diversion, and main canals and/or pipelines used to convey the water, are delineated on Plate 2, "Land and Water Use." The diversions are listed by diversion location numbers in Table 5, "Descriptions of Surface Water Diversions" beginning on page 38, and alphabetically by owner in Table 7, "Index to Surface Water Diversions," beginning on page 73.

<sup>1/</sup> "Cache Creek Project Report," McCreary, Koretsky & Hill, January, 1963.  
<sup>2/</sup> Department of Water Resources Bulletin No. 90, March 1961.  
<sup>3/</sup> USGS Water Supply Paper No. 1715.

In some situations, water users make efficient use of water by rediverting field runoff or spill collected from their own upstream diversion systems. In this investigation, such points of rediversion were not located. However, if return flow from another water user's operation was rediverted, or if there was doubt as to the origin of the water, then the diversion point was located. Diversion systems of water companies or groups of water users are considered as single units; individual customer distribution points are not located or shown on Plate 2.

### Surface Water Diversions

The description, history, and other information relating to each surface water diversion was obtained through field inspections, interviews with the water user or his representative, and by reference to prior reports and official records. This information is summarized in Table 5. The data in the table are arranged by diversion location number with each subunit. All points of diversion in use during 1959 and those which had been used within the preceding five years, and the conduits used for delivery were delineated on aerial photographs. Reservoirs which had surface areas of about three acres or greater were also noted. Three acres were considered the minimum surface area that could be delineated on the aerial photographs. Reservoirs located along and operated in conjunction with canals and ditches which have been located at their origin are shown on Plate 2 but are not necessarily considered as separate systems nor assigned location numbers. Similarly, water supplies obtained from small intermittent streams intercepted by canal systems are not classed as separate diversions.

Surface water diversions are numbered to indicate their location by township, range, and section within the federal land survey system. Each section is subdivided into 40-acre plots, and lettered as illustrated on Plate 2.

Diversions are numbered within each of these 40-acre plots according to the order in which they were located. For example, diversion D14N/9W-32C1, which is shown on Sheet 6, of Plate 2 as "32C1," is the first diversion located in the northeast quarter of the northwest quarter of Section 32 in Township 14 North, Range 9 West, Mount Diablo Base and Meridian (MDB&M).

The purpose of each diversion, the quantity of water diverted during 1960, the extent of use, such as the number of acres irrigated, and the method of application of water are described. If the purpose listed is not the usual use for that diversion, notation is made in the remarks column. The extent of domestic use is specified only when five or more connections are served. Stockwatering less than 10 head of livestock is considered to be a domestic use.

The type of water right under which the respective diversions are considered to be made is indicated under the heading "Apparent Water Right." The determination of this item is based upon the best information available from the owner, from files of the State Water Rights Board, from official records, and from other sources. The amount of the right, if established and known, and a reference to the source of data are also included. Although this information is believed to be accurate, it is emphasized that it is not based on sworn claims or testimony and should in no way be construed to represent a conclusive determination of water rights.

Diversions based on appropriative rights are listed as "appropriative." Those that are not appropriative, but for which the area of use is apparently riparian to the streams or which the owner claims to be riparian, are listed as "riparian." Diversions listed as appropriative may also be riparian, no attempt was made in such cases to determine the riparian status.

For appropriative rights, the amount tabulated is that specified in the recorded filing, if found, or in the application filed with the State Water Rights Board, or in the latest permit or license.

## Measurement of Diversions

Quantities of surface water diverted during 1960 were measured to further describe the diversion systems. The measured quantities do not necessarily represent average diversions, since during any single year the quantity diverted will be influenced by precipitation during the growing season, the available streamflow, and the nature of use. Considerations other than the available water supply, such as economic factors, may also affect the relation of any diversion record to typical operating conditions. No attempt was made to assess these factors.

Results of the measurements are summarized in Table 6, "Monthly Records of Surface Water Diversions," beginning on page 66. The total amount of water diverted at the 88 diversions which were measured was about 13,324 acre-feet of which 12,122 acre-feet were for irrigation and 1,202 acre-feet for urban and domestic uses.

The diversion quantities reported herein generally represent the actual amounts of water taken from the respective sources, and therefore include recoverable and irrecoverable losses incidental to the primary use. Substantially all diversion measurements were started by March of 1960, prior to the commencement of intensive irrigation. These measurements were continued through the irrigation season, and in some cases, the entire year to obtain a complete record.

Diverted quantities were determined primarily by measurement of open channel flow and testing of pumps. Periodic current meter measurements of the open channel were made during the diversion season to obtain channel ratings. The water surface stage was recorded either by weekly observations of a staff gage or with a continuous water stage recorder, from which quantities of flow

were calculated. Pumps were similarly rated and quantities of flow calculated from operation or power records. Existing weirs were used whenever available. These observations were supplemented by interview of water users to obtain additional data on possible abrupt changes in operation.

The measurements were classed as estimates when data were incomplete or uncertain. A notation is entered in the table if the diversions were located late in the survey resulting in an incomplete seasonal measurement. Diversions for which measurements or estimates were impossible, are described and indexed in Tables 5 and 7, respectively, but are not included in Table 6. When feasible, measurements of each diversion were made at a location above the area of first use and as close to the diversion intake as possible, but below any regulatory spill. Exceptions are noted in the table.

When the recorded data were considered sufficiently reliable, monthly diversion quantities are shown in acre-feet. However, when the recorded data were incomplete or missing, the following notations are used. "-----xx-----" is used to indicate that the data were sufficient to estimate the total quantity only. A superscript "e" is used when an estimate of flow for 10 days or more in any one month was required. "----NR----" is used to indicate the period during which no recorded data were available.

### Major Diversions

There are two major diversions in the unit, Clear Lake Impounding Dam and Monticello Dam. These are both diversions to storage during the runoff season for release during the irrigation season. The points of redirection are located outside the unit on the Sacramento Valley floor.

The Clear Lake Impounding Dam, diversion location number D12N/6W-6B1, is operated by the Clear Lake Water Company. The water stored is used for

recreational purposes in the unit and for irrigation of Yolo County lands located in the area between Cache and Putah Creeks.

The history of the Clear Lake Water Company operations goes back to 1856 when the Moore Diversion Works was first used to divert water to irrigate lands in the vicinity of Woodland. Several companies including the Yolo Consolidated Water Company, the Capay Ditch Company, and the Yolo Water and Power Company have contributed to the development of the system. The latter company constructed the Clear Lake Impounding Dam in 1915 to provide storage of winter runoff in Clear Lake for release during the irrigation season.

The volume of water in Clear Lake, from 0.0 feet to 7.56 feet on the Rumsey gage located at Lakeport, is about 314,000 acre-feet. The storage and release of water from Clear Lake for irrigation purposes are regulated by the Gopcevic Decree and the Bemmerly Decree. The texts of these decrees are given in Appendix D. The Clear Lake Water Company has operated the system since 1927 during which period an average of 105,000 acre-feet per season has been diverted from Cache Creek to serve an average irrigated area of 19,000 acres per season. The maximum seasonal diversion of 189,000 acre-feet occurred in 1946 to serve 29,000 acres while the minimum seasonal diversion of 7,300 acre-feet occurred in 1931 to serve 7,000 acres.

Based on figures found in U. S. Geological Survey, Water Supply Paper No. 1715, and a height-capacity curve for the Rumsey gage at Lakeport, the approximate maximum usable amount of water stored in Clear Lake during 1959-60 (limits stipulated by the Gopcevic Decree of 1920) was 278,000 acre-feet on April 5-9, 1960.

Monticello Dam, completed in 1957, diversion location number D8N/2W-29G1 is a part of the multipurpose Solano Project of the U. S. Bureau of Reclamation. It is designed to conserve the runoff of Putah Creek to supply

Clear Lake

Bob's Marina  
at  
Clear Lake Oaks

water for extensive agricultural, municipal and industrial uses outside the unit in Solano County. Flood control is provided in the lower reaches of Putah Creek and large scale water-associated recreational areas are made available within the unit.

With a storage capacity of 1,600,000 acre-feet, the firm annual yield from Lake Berryessa is estimated to be 262,000 acre-feet, of which 216,000 acre-feet are allocated to irrigation, 31,000 acre-feet for municipal, industrial, and domestic use, and 15,000 acre-feet for downstream use along Putah Creek. In 1960, the maximum amount stored in Lake Berryessa was 1,144,200 acre-feet <sup>1/</sup>, the total release from the reservoir was 95,545 acre-feet and the total seasonal diversion at Putah South Canal was 66,787 acre-feet.

#### Index to Diversions

For the convenience of the reader, an alphabetical index of diversion owners and diversion names, along with the subunit location of each diversion and references to map and page numbers on which data concerning each appear, is shown in Table 7, page 73.

#### Water Rights

A water right is a right, granted by law, to take possession and put to beneficial use, water occurring from a natural source of supply. The five principal types of water rights in California are riparian, overlying, appropriative, prescriptive, and pueblo. A description of these rights is presented in Appendix C, "Legal Considerations."

---

<sup>1/</sup> In May 1963, Lake Berryessa reached its maximum capacity of 1,600,000 acre-feet.

The rights to the surface water of the unit are primarily based on appropriative or riparian status and have frequently been the subject of controversy and litigation. In the Cache Creek Basin, controversy first occurred in 1853 with the first reported court case in 1870. Court actions continued over the years culminating in 1920 with the case of "Gopcevic vs Yolo Water and Power Company." A copy of the decree is included in Appendix D. In 1940, court action occurred again, resulting in the "Bemmerly Decree." A copy of this decree is also included in Appendix D. Most of these court actions concerned Clear Lake dam and its construction or operation. In the Putah Creek Basin, a court suit was filed in 1922 to establish riparian rights, but it affected an area outside of the unit and is not summarized in this report.

Most of the diversions in the unit are under riparian rights or under appropriative rights established subsequent to the enactment of the Water Commission Act of 1914. As of January 1, 1963, a total of 183 currently active applications had been made in the unit under provisions of the Water Commission Act. Permits or licenses have been granted for 154 of these applications, 12 are pending before the State Water Rights Board, and 17 were incomplete. These applications are tabulated in Table C-1, page C-11.

 DESCRIPTIONS OF SURFACE WATER DIVERSIONS IN  
 PUTAH - CACHE CREEKS HYDROGRAPHIC UNIT

Diversion location and Plot 2 sheet number	Diversion name and/or owner	Source	Water use in 1960			Apparent water right			Indicated date of appropriation or first use	Description of diversion system	Remarks
			Purpose	Extent and method of use	Amount diverted in acre-feet	Type	Amount	Reference			
UPPER LAKE SUBUNIT (Continued)											
M. D. B. & M. DLSN/10W-13B2 (Sheet 4)	Lake County Cannery	Scotts Creek	Irrig. <sup>a</sup>	(*)	None	Riparian	--	--	1896	Pump; 32 hp gasoline engine with a 6- inch pipeline. <sup>a</sup>	Former owner: Clear Lake Cannery, Inc. Previously irrigated jointly with DLSN/10W-12R1. This pump can also be used at DLSN/10W-12R1.
DLSN/9W-31M1 (Sheet 2)	Waverly J. and Kate Slattery	Middle Creek	Irrig.	21 acres by sprinkler	34	Approp.	.21 cfs	A-6904 <sup>a</sup>	1956	Pump; 15 hp electric motor with a 6- inch pipeline.	Former owner: George Haycock.
DLSN/9W-32P1 (Sheet 2)	Virgil Wade	Poge Creek	Irrig.	43 acres <sup>*</sup>	Not meas.	Riparian	--	--	1947	Gravity; earth dam 12 feet high, 400 feet long.	Acreage reported is sub-irrigated by seepage from reservoir.
DLSN/10W-21Q1 (Sheet 2)	Paul Gambonini	Springs tributary to Scotts Creek	Stock.	150 head	Not meas.	(b)	--	--	1950	Storage; earth dam 22 feet high, 200 feet long. Storage capacity: 10 af.	
DLSN/10W-28H1 (Sheet 2)	Paul Gambonini	Spring tributary to Scotts Creek	Domestic Stock.	(d) 150 head	Not meas.	Riparian	--	--	About 1915	Gravity; 1.2 miles of 1.5- inch pipe.	Former owners: Boone Howard, John McClendon, George DeLiggs, Hal Owens, James Cockburn.

- \* See remarks.  
 -- Information not available.  
 a Refers to applications to appropriate water filed with the State Water Rights Board.  
 b Insufficient information to determine type of apparent water right.  
 c Lake County Records.  
 d Domestic use by less than 5 families or connections.  
 e For additional information, see appendix C.

### CHAPTER III. LAND USE

The results of a survey of water use and diversion facilities in the Putah-Cache Creeks Hydrographic Unit were presented in Chapter II. In this chapter, the results of a survey of present land use as related to water use and a brief summary of historical conditions are reported. A thorough knowledge of the nature and extent of land and water uses under past and existing conditions is one of the primary requisites in evaluating future water requirements.

#### Historical Land Use

The first recognized agricultural land use in the unit was about 1840, when settlers arrived to begin farming activities in the fertile valleys near Clear Lake. Prior to the settlers' arrival, the land, with an abundant supply of obsidian (for arrowheads) and game, was inhabited by the Pomo Indians.

The early agricultural interests centered around the production of grain, hay, and livestock. Today the major crops are pears and walnuts, which constitute 42 percent of the total agricultural land in production and account for approximately 75 percent of the unit's total agricultural economy. The raising of livestock has continued to have significant importance in the unit, particularly in the Upper Putah Creek area.

Previous land use surveys utilized in preparing this report are; the 1946 survey in Big Valley by the Bureau of Reclamation, U. S. Department of the Interior; the 1948-1949 survey by the Department of Water Resources; and a resurvey by the Department of Water Resources in 1952-1953.

## Methods and Procedures

A detailed survey of land use in the Putah-Cache Creeks Hydrographic Unit was conducted in 1960. Land use analysts delineated the use of each parcel of land on the aerial photographs that had the surface water diversion locations identified from the water use survey. The unit was traversed by automobiles as completely as roads and terrain permitted and, where necessary, inspections were made on foot. An example of land use delineated on an aerial photograph is shown on page 89.

After completion of the field mapping, the data delineated on the photographs were transferred to copies of United States Geological Survey quadrangle maps at a scale of 1:24,000. This procedure was necessary to bring the delineated areas to a common scale for accurate determination of acreages. These maps, showing the land use, the location of all diversions, and the fields associated with each diversion, including idle and fallow lands, were colored according to the land use categories. Public meetings were held at which the local people were asked to review and submit revisions, if any. These maps were revised if warranted, and then used in the preparation of Plate 2.

A duplicate set of these maps was used in computing the acreages of the land uses. Each delineated area was manually cut out and was carefully weighed on an analytical balance. These weights were converted to acreages using ratios determined for each of the individual maps. This method has proven to be a very expedient and accurate means of area determination where many small parcels are involved.

## Present Land Use

The land uses, as mapped in this survey, are tabulated as they relate to water use such as irrigated lands, naturally high water table lands, dry-farmed lands, urban lands, and recreational lands. Lands not falling into one of these categories were mapped and are tabulated as native vegetation. Sheets 1 through 19 of Plate 2 are maps detailing the land uses. The acreages of land uses within each subunit are presented in Table 8, "Land Use in Putah-Cache Creeks Hydrographic Unit, 1960," on page 96. These values represent gross acreages, including nonwater service areas such as roads, ditches, building and storage areas, and miscellaneous rights-of-way, which occur within mapped areas.

### Irrigated Lands

Irrigated lands, as designated in this report, include all agricultural lands which receive artificially applied water. The acreages of irrigated lands are reported in Table 9, "Irrigated Lands," on page 97, tabulated by individual surface water diversion or by ground water, and segregated into forage crops, field crops, orchard, truck crops, miscellaneous, and idle or fallow irrigated lands. Forage is further subdivided into alfalfa, sudan, and pasture; native pasture lands having a high water table induced by the application of irrigation water are included under pasture. Field crops are subdivided into corn, hops, and sorghum. Orchard is subdivided into pears, prunes, walnuts, and miscellaneous. Idle irrigated lands are those lands which were not irrigated in the year of survey but which had been irrigated within the preceding three years. Fallow irrigated lands are those cultivated lands which may have been irrigated during the year of survey, but which at the time of survey were only tilled and not planted to a crop.

Irrigated  
Pasture in  
Big Valley

Cattle Grazing  
Near  
Upper Lake

The irrigated lands were identified on work maps by diversion location and by crop. On Plate 2 the irrigated lands are grouped into six categories: (1) lands which received a full irrigation during the year of survey, (2) lands which received only partial irrigation because of insufficient water supply, (3) lands usually irrigated but which were idle or fallow in 1960, (4) dry-farmed lands susceptible of irrigation, (5) lands irrigated entirely by ground water, and (6) lands irrigated by surface and ground water. Dry-farmed lands susceptible of irrigation are those lands planted to a dry-farmed crop which had a usable irrigation system in existence at the time of the survey.

#### Naturally High Water Table Lands

In addition to the lands which receive water as described above, there were lands supporting vegetation utilizing water from a naturally high water table, such as mountain meadows or lands adjacent to lakes and streams. These are shown in Table 8 and on Plate 2 as "Meadowlands." If standing water was observable in an area on which tules, cattails, bullrushes, and similar vegetation were growing, the area is shown in Table 8 and on Plate 2 as "Marshlands."

#### Dry-Farmed Lands

Dry-farmed lands are those lands normally planted to a crop but which do not receive artificially applied water and includes all lands so farmed whether or not a crop is produced in the year of survey. Although lands were mapped as "dry-farmed idle" if uncultivated in the year of survey and "dry-farmed fallow" if tilled but without a crop, they are shown in Table 8 and on Plate 2 as "Dry-Farmed Lands." Lands which had been uncultivated for more than three years and appeared to have reverted to "native vegetation," were so mapped.

It should be noted that the term "dry-farmed" as used herein refers to the farming practice on the lands and not to a lack of soil moisture.

Since noncultivated range lands are usually indistinguishable from similar lands not used for grazing purposes, both were designated as native vegetation. Water use in both cases is essentially the same and is dependent upon precipitation.

#### Urban Lands

Urban lands include the total areas of cities, towns, small communities, industrial plots, lawn areas, and cemeteries, which were large enough to be delineated. The acreages represent gross delineations, including streets and vacant lots. In this survey the boundaries of urban communities were delineated to include all lands with a density of one house or more per two acres.

#### Recreational Lands

Recreational lands were mapped on the aerial photographs in the field in four categories: (1) residential, (2) commercial, (3) camp and trailer sites, and (4) parks. Recreational residential lands include permanent and summer home tracts within a primarily recreational area. The estimated density of homes per acre was also indicated. Recreational commercial lands included those containing motels, resorts, hotels, stores, restaurants, and similar commercial establishments in primarily recreational areas. Lands mapped in the camp and trailer site category, included those areas so used within primarily recreational areas outside the boundaries of parks. The entire area within the boundaries of parks was included without regard to specific uses. Obviously, nearly all of the mountainous and water surface areas are suitable for some recreational activities; however, for the purpose of this land use survey, consideration was given only

to those lands where some fairly intensive development requiring water service was evident.

The recreational lands are combined in one group in Table 8 and on Plate 2. The areas delineated were not necessarily fully developed.

### Native Vegetation

Lands which were essentially in a native state and not included in any of the above categories were mapped as native vegetation. These lands may have been used to some extent for mining, commercial timber production, livestock range, and recreational activities such as fishing, hunting, hiking, and picnicking. They total approximately 916,350 acres or 94 percent of the Putah-Cache Creeks Hydrographic Unit. Included in these areas are water surfaces, scattered residences, farm buildings, storage yards, military reservations, and other isolated uses covering a few acres or less which were too small to be mapped separately.

The major water surface areas included under the native vegetation classification are the large surface areas of Clear Lake, 39,320 acres and Lake Berryessa, 19,130 acres. The surface area of Clear Lake, as reported herein, is that determined by the Land Use and Land Classification Surveys conducted for this report. It does not agree with the surface areas previously reported in other publications due to the differentiation of the extensive marshlands around the periphery of the lake as "Marshlands" rather than water surface area.

\*, ( ) Indicates an intercrop. The asterisk refers to a primary intercrop which is included in the totals. The parenthesis refers to the secondary intercrop which is not included in the totals.

<sup>a</sup> Includes irrigated grain, safflower, and vineyard lands.

<sup>p</sup> Includes 193 acres intercropped with alfalfa, corn, pears, sorghums and miscellaneous crops.

#### CHAPTER IV. LAND CLASSIFICATION

Calculations of future water requirements will be based in a large part on a classification of lands with regard to their potential for irrigated agricultural and recreational development. The results of such a land classification survey in the Putah-Cache Creeks Hydrographic Unit are presented in this chapter.

Lands were not classified in this survey with respect to their potential for future urban development. The use of land for urban purposes is more closely related to the population density at any given time than to its physical characteristics. It is planned to defer the designation of these lands until estimates of population and related economic studies are made in connection with determinations of future water requirements.

The former Division of Water Resources made a reconnaissance classification of lands of the State, which was reported in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," dated June 1955. A more detailed land classification survey was performed by the department and reported in Department of Water Resources Bulletin No. 58, "Northeastern Counties Investigation," 1957. The Lake, Colusa, and Yolo Counties portions of the Putah-Cache Creeks Hydrographic Unit were included in Bulletin No. 58.

The land classification survey for this report uses these previous land classification surveys as a base, however, additional data on classification of recreational lands have been included along with some modifications to the irrigable agricultural lands and a remapping of the present urban lands. Because of construction of Monticello Dam, the lands within the high-water line of Lake Berryessa have been deleted from the irrigable and urban classifications as reported in prior surveys.

## Methods and Procedures

The general methods and procedures used in field mapping and tabulation of information were essentially the same as those described for the land use survey in Chapter III. An example of land classification delineations on an aerial photograph is shown on page 117. The standards used in the classification of lands are given in detail in Table 11, "Land Classification Standards," page 123.

### Major Categories of Land Classes

The lands mapped are grouped into four major categories: (1) irrigable lands, (2) present urban lands, (3) recreational lands, and (4) miscellaneous lands. Results of the land classification survey are shown on Plate 3, "Classification of Lands," Sheets 1 through 19. The areas of each classification are listed in Table 10, "Classification of Lands in Putah-Cache Creeks Hydrographic Unit," page 122.

#### Irrigable Lands

Irrigable lands are grouped in appropriate classifications according to their suitability for development under irrigated agriculture and their crop adaptability. Presently irrigated lands are included within these classifications, but urban lands and recreational lands were not classed as to irrigability. The time element, with respect to when the lands might be developed, did not enter into the determination, except that suitability for irrigated agriculture was necessarily considered in light of the present agricultural technology.

Example of Land Classification  
Delineated on Aerial Photograph

(See Table 11, page 123 for symbol explanation)

There are many factors which influence the suitability of land for irrigation development. Since soil characteristics and the physiography of the landscape are the most stable of these factors, they were the only ones considered in the survey in classifying lands as to their irrigability. The characteristics of the soil were established by examination of road cuts, ditch banks, and the material from test holes, together with observations of the type and density of native vegetation and crops. Representative slopes throughout the area were measured with a clinometer. Other aspects, such as the economic factors related to the production and marketing of climatically adapted crops, the location of lands with respect to a water supply, and climatic conditions, were not considered in the basic classification. These latter factors are very important in estimating the nature of future cropping patterns and practices and will be given due consideration when estimates are made of future water requirements.

#### Urban Lands

It is recognized that future urban expansion will encroach upon some of the irrigable lands. The location and extent of this type of development is a function of many variables. Because this land classification survey is an inventory of relatively unchanging physical conditions, no attempt was made to locate the areas of future urban encroachment. Therefore, only those lands devoted to urban uses in 1960 were classified as "urban" lands.

#### Recreational Lands

Present trends indicate an expanding rate of use and demand for recreational facilities throughout the State. In view of these trends and the ever-increasing population, it is recognized that there will be a demand for substantial land areas for recreational purposes. This is particularly true of

the mountainous regions where development is expanding rather rapidly at the present time.

Generally speaking, all mountainous lands are suitable for some recreational use such as hunting, fishing, and similar outdoor activities. However, for purposes of this survey, lands classified for recreational uses were limited to those which were, at the time of the survey, or may in the future be used intensively for permanent and summer home tracts, camp and trailer sites, and parks outside of urban areas. These are lands requiring intensive water service.

Primary considerations for classification of home tracts and camp and trailer sites are such physical factors as soil depths, slope, and rockiness; such aesthetic values as view, nearness to lakes and streams, or density and type of forest canopy suitable for the respective uses, and the plans of United States and state forest officials. An important factor in the location of camp and trailer sites was the availability of a water supply, but isolation from existing roads did not influence site selection.

The only parks in the unit at the time of the survey were the Clear Lake State Park and the Lake County Park located about 1.5 miles northeast of Kelseyville on the southern shore of Clear Lake.

#### Miscellaneous Lands

Lands which failed to meet the requirements previously described in this chapter are herein called "Miscellaneous lands" and appear in Table 10 as "F" lands, "Vm" lands, and "N" lands.

The presently forested lands or lands best suited for forest management, which are otherwise irrigable, were classed as "F" lands. Lands which were designated in the land use survey as "marshlands," were classified as "Vm" lands, except those marshland areas considered to have a recreation potential due to the

Spanish Flat,  
Marina on  
Lake Berryessa

Clear Lake at  
Konocti Bay

current progress of reclamation practices. The lands mapped as "N" include all lands which failed to meet the requirements of the above classes. Included are the surface areas of Clear Lake, 39,320 acres, and Lake Berryessa, 19,130 acres.

TABLE 11

## LAND CLASSIFICATION STANDARDS

Symbol :	Characteristics
Irrigable Lands	
V	<p>These lands are level or slightly sloping and vary from smooth to hummocky or gently undulating relief. The maximum allowable slope is 6 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils have medium to deep effective root zones, are permeable throughout, and free of salinity, alkalinity, rock, or other conditions limiting crop adaptability of the land. These lands are suitable for all climatically adapted crops.</p>
H	<p>These are lands with greater slope and/or relief than those of the V class. They vary from smooth to moderately rolling or undulating relief. The maximum allowable slope is 20 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils are permeable, with medium to deep effective root zones, and are suitable for the production of all climatically adapted crops. The only limitation is that imposed by topographic conditions.</p>
M	<p>These are lands with greater slope and/or relief than those of the H class. They vary from smooth to steeply rolling or undulating relief. The maximum allowable slope is 30 percent for smooth, reasonably large-sized bodies lying in the same plane. As the relief increases and becomes more complex, lesser slopes are limiting. The soils are permeable, with medium to deep effective root zones, and are suitable for the production of all climatically adapted crops. The only limitation is that imposed by topographic conditions.</p>
<p>The foregoing may be modified, as conditions warrant, by use of one or more of the following symbols.</p>	
w	<p>Indicates the presence of a high-water table, which in effect limits the present crop adaptability of these lands to pasture crops. Drainage and a change in irrigation practice would be required to affect the crop adaptability.</p>
s	<p>Indicates the presence of an excess of soluble salts or exchangeable sodium in slight amounts, which limits the present adaptability of these lands to crops tolerant to such conditions. The presence of salts within the soil generally indicates poor drainage and a medium to high-water table. Reclamation of these lands will involve drainage and the application of small amounts of amendments and some additional water over and above crop requirements in order to leach out the harmful salts.</p>

TABLE 11 (continued)

Symbol :	Characteristics
ss	Indicates the presence of an excess of soluble salts or exchangeable sodium in sufficient quantity to require the application of moderate amounts of amendments and some additional water over and above crop requirements in order to effect reclamation.
sa	Indicates the presence of an excess of soluble salts or exchangeable sodium in sufficient quantity to require the application of large amounts of amendments and some additional water over and above crop requirements in order to effect reclamation.
h	Indicates very fine textures, which in general make these lands best suited for the production of shallow-rooted crops.
l	Indicates fairly coarse textures and low moisture-holding capacities, which in general make these lands unsuited for the production of shallow-rooted crops because of the frequency of irrigations required to supply the water needs of such crops.
p	Indicates shallow depth of the effective root zone, which in general limits use of these lands to shallow-rooted crops.
r	Indicates the presence of rock on the surface or within the plow zone in sufficient quantity to prevent use of the land for cultivated crops.
-(L)	Indicates ground cover varying from a light to moderately dense growth of low brush through a low density growth of medium height trees.
-(M)	Indicates ground cover varying from a high density growth of low brush through a moderately dense growth of medium height to tall trees.
-(H)	Indicates ground cover varying from a high density growth of medium height trees through a very dense growth of large trees.
-2, -4 -6, -8	Number indicates in feet the average difference between highs and lows due to microrelief.
-B	Indicates low-lying basin and seep areas.

#### Urban and Recreational Lands

UD The total area of cities, towns, and small communities presently used for residential, commercial, recreational, and industrial purposes.

TABLE 11 (continued)

Symbol :	Characteristics
SR	Existing and potential suburban residential areas which have a low population density. These lands are further subdivided into either a high or low water using category. This is indicated by a number in the symbol, i.e., SR-1 includes those lands where it is expected the entire area will be utilized for lawns, gardens, small orchards, etc., and has a high water use. SR-2 indicates lands where a large percentage of the area is expected to be nonwater using, hence an area of low water use. All the SR lands are also classed according to the four major topographic classes used for the classification of irrigable lands, i.e., V, H, M, and N.
RR	Existing and potential permanent and summer home tracts within a primarily recreational area. The estimated number of houses, under conditions of full development, is indicated by a number in the symbol, i.e., RR-3 is suitable for three houses per acre.
RC	Existing and potential commercial areas which occur within a primarily recreational area and which include motels, resorts, hotels, stores, etc.
RT	Existing and potential camp and trailer sites within a primarily recreational area.
PP	Existing racetracks, fairgrounds, and private, city, county, state, and federal parks.

#### Miscellaneous Lands

F	Presently forested lands, or lands subject to forest management, which meet the requirements for irrigable land but which, because of climatic conditions and physiographic position, are better suited for timber production or some type of forest management program rather than for irrigated agriculture.
Va	Smooth lying valley lands which are affected by such heavy concentrations of salts that further detailed studies would be required to determine the feasibility of reclaiming these lands for irrigated agriculture.
Vm	Swamp and marsh lands which usually support a heavy growth of phreatophytes and are covered by water most of the time.
N	Includes all lands which fail to meet the requirements of the above classes.

## CHAPTER V. SUMMARY

The Putah-Cache Creeks Hydrographic Unit covers the watersheds of Putah Creek above Monticello Dam, and of Cache Creek above the gage "Cache Creek above Rumsey," including the watersheds of the tributaries to Clear Lake. It includes 1,016 square miles of Lake County, 362 square miles of Napa County, 103 square miles of Colusa County, 35 square miles of Yolo County, and 3 square miles of Mendocino County.

Valley and foothill lands constitute about 130,657 acres or 14 percent of the total area in the unit. Agriculture is the largest single commercial enterprise in the unit with 27,779 acres or 57 percent of the agricultural lands dry-farmed, and 18,174 acres or 38 percent irrigated. The major irrigated crops are pears and walnuts. Historically, mineral production and agriculture were the basic industries of the unit but in later years, mineral production declined in importance and has been replaced by water-associated recreational activities centered around Clear Lake and Lake Berryessa.

### Water Use

The water rights in Putah-Cache Creeks Hydrographic Unit are primarily based on riparian rights or on appropriative rights established after the enactment of the Water Commission Act in 1914. The remainder are unknown or appropriative rights established prior to 1914 by merely diverting and using the water. One of the largest diversions in the unit falling under the appropriative rights established prior to 1914 is the Clear Lake diversion owned by Clear Lake Water Company.

As of January 1, 1963, a total of 183 active applications to appropriate water in the unit were on file with the State Water Rights Board; of these, 154 had received a permit or a license, 12 were pending, and 17 were incomplete.

Of the 271 surface water diversions located, 88 representative diversions were measured during 1960. The primary use and amount diverted are summarized below.

<u>Primary use</u>	<u>Diversions located</u>	<u>Diversions measured</u>	<u>Amount measured (acre-feet)</u>
Irrigation	205	77	12,122
Stockwatering	24	0	0
Domestic	20	2	110
Municipal	10	9	1,092
Recreation	7	0	0
Industrial	3	0	0
Mining	<u>2</u>	<u>0</u>	<u>0</u>
TOTALS	271	88	13,324

The above tabulation of irrigation diversions located includes Monticello Dam of the U. S. Bureau of Reclamation and Clear Lake Impounding Dam of the Clear Lake Water Company. These were the two major diversion systems located in the unit, but were not included in the measurement records because the primary use of the water was outside the unit. The total release through Monticello Dam in 1960 was 95,545 acre-feet and the maximum storage reached in Clear Lake above zero on the Rumsey gage was 278,000 acre-feet on April 5-9, 1960.

The total consumptive use of applied surface and ground water for irrigated agriculture in the unit during 1960 is estimated to have been 29,926

acre-feet. The estimated consumptive use values for domestic and municipal, stockwatering, recreation, industrial, mining, and other uses are not included in this report because of insufficient data.

### Land Use

Areas of the 1960 land uses within the Putah-Cache Creeks Hydrographic Unit are summarized below and presented pictorially in Figure 1, page 131.

<u>Use</u>	<u>Area in acres</u>
Agricultural lands	
Lands irrigated in 1960	17,315
Lands normally irrigated but idle or fallow in 1960	859
Meadowlands	770
Marshlands	1,701
Dry-farmed lands	<u>27,779</u>
Total agricultural lands	48,424
Recreational lands	4,100
Urban lands	3,176
Native vegetation	
Water surfaces of Clear Lake and Lake Berryessa	58,450
Other lands	<u>857,902</u>
Total native vegetation	<u>916,352</u>
TOTAL AREA OF UNIT	972,052

### Land Classification

The land classification surveys reported in Department of Water Resources Bulletins Nos. 58, 90, and 99 were used in this investigation, with additional data on classification of recreational lands, some minor modifications to the irrigable agricultural lands, and a resurvey of present urban lands. The results of these surveys are summarized below and presented pictorially in Figure 2, page 131.

<u>Classification</u>	<u>Area in acres</u>
Irrigable agricultural lands	130,657
Recreational lands	58,348
Present urban lands	3,176
Miscellaneous lands	
Irrigable forest management lands	14,815
Water surfaces of Clear Lake and Lake Berryessa	58,450
Other lands (includes marshlands)	<u>706,606</u>
TOTAL AREA OF UNIT	972,052

CLASSIFICATION OF LANDS

APPENDIX A  
STATEWIDE WATER RESOURCES AND WATER  
REQUIREMENTS PROGRAM

## APPENDIX A

### STATEWIDE WATER RESOURCES AND WATER REQUIREMENTS PROGRAM

California's major water problem today is that of development and delivery of supplemental water supplies to meet increasing water requirements throughout the State. The problem involves (1) the regulation of seasonal and cyclic fluctuation of streamflow to meet demand schedules in the areas of origin, and (2) the transmission of regulated surplus flows over long distances to areas of deficiency. The development and long distance transfer of water is currently accomplished by such major facilities as the Federal Central Valley Project and the Colorado River Aqueduct of The Metropolitan Water District of Southern California. However, such development and transfer will be considerably broadened in scope by the State Water Facilities.

Consumptive water requirements of the State on a basin-wide basis were estimated in State Water Resources Board Bulletin No. 2, "Water Utilization and Requirements of California," June 1955. However, to provide for local water needs while considering specific export projects, more detailed information must be made available on present and projected future water requirements of the areas in which the projects are to be built. This will necessitate the considerably more detailed collection and analysis of data on hydrology, land use and land capability, and economics.

Recognizing that additional information is needed if the water needs of areas of origin are to be adequately protected in large-scale water development projects, the 1956 Legislature authorized an investigation to determine the water resources and water requirements of the respective watersheds in the State. The authorization is contained in Chapter 61, Statutes of 1956, as amended by Chapter 2025, Statutes of 1959. This legislation is codified in Section 232 of the Water Code as follows:

"232. The Legislature finds and declares that in providing for the full development and utilization of the water resources of this State it is necessary to obtain for consideration by the Legislature and the people, information as to the water which can be made available for exportation from the watersheds in which it originates without depriving those watersheds of water necessary for beneficial uses therein. To this end, the department is authorized and directed to conduct investigations and hearings and to prepare findings therefrom and to report thereon to the Legislature at the earliest possible date with respect to the following matters:

(a) The boundaries of the respective watersheds of the State and the quantities of water originating therein;

(b) The quantities of water reasonably required for ultimate beneficial use in the respective watersheds;

(c) The quantities of water, if any, available for export from the respective watersheds;

(d) The areas which can be served by the water available for export from each watershed; and

(e) The present use of water within each watershed together with the apparent claim of water right attaching thereto, excluding individual uses of water involving diversions of small quantities which, in the judgment of the Director of Water Resources, are insufficient in the aggregate to materially affect the quantitative determinations included in the report.

Before adopting any findings which are reported to the Legislature, the department shall hold public hearings after reasonable notice, at which all interested persons may be heard."

For purposes of this inventory, the State has been divided into 12 major hydrographic areas. These areas, in turn, have been subdivided into hydrographic units generally comprising watersheds of individual rivers. Basic data on present water uses, together with the apparent claim of water right attached thereto, present land uses, history of land and water uses, and the classification of lands will be presented separately for each hydrographic unit in this series of reports on land and water use. This bulletin, No. 94-13, "Land and Water Use in Putah-Cache Creeks Hydrographic Unit," is the 13th of a series reporting the results of these surveys.

At a future date, estimates will be made of quantities of water reasonably required for future beneficial uses in each watershed. The quantity of water potentially available for export from each watershed will be determined after allowances are made for the satisfaction of the local requirements and prior rights to divert water to other areas. For those watersheds in which no exportable water is available, the water supply deficiency will be determined. These estimates will be published as they become available.

The calculations of future water requirements will be based, in part, on predicted future land uses derived from land classification surveys, economic studies, population forecasts, industrial and agricultural development, and recreational needs. Agricultural water requirements will be based on unit water use by the various predicted crop types; urban and recreational requirements on per capita water use values; fish and wildlife requirements on minimum streamflow needed or on water demands for wildlife area; and industrial water requirements on measured water deliveries to various types and sizes of industries now existing. In forecasting future industrial development, water quality problems will be given full consideration.

Water resources will be determined from records of all stream gaging stations, including new stations which were established for this and other investigations of the department. The new stations were generally constructed on streams which originate in the smaller watersheds for which runoff data are necessary but for which no data have been available.

## APPENDIX C

### LEGAL CONSIDERATIONS

There are set forth in the following paragraphs brief general statements with respect to the California law of water rights to supplement and to provide a background for information on water rights contained in Chapter II. Also included is a tabulation of currently active applications to appropriate water within Yuba-Bear Rivers Hydrographic Unit filed with the State Water Rights Board.

#### California Water Rights

In California, water rights convey only the right to use water. Until absolute possession of water is acquired by some artificial means, no one owns water. However, the owner of water rights is entitled to enjoy them without interference by other users who have rights which are inferior to his.

Five kinds of water rights are recognized in California. These are riparian, overlying, appropriative, prescriptive, and pueblo. Riparian rights attach to surface water and water flowing in known and definite subterranean channels, while overlying rights attach only to underground water. Appropriative and prescriptive rights may be acquired in either surface or underground waters. Pueblo rights are now exercised in California only by the Cities of Los Angeles and San Diego, each of which has a paramount right to satisfy the former Mexican pueblo from which each sprang.

All water rights, both to surface and to underground water, are subject to the doctrine of reasonable beneficial use expressed in

Section 3 of Article 14 of the California Constitution, and Water Code Sections 100 and 101. This doctrine limits water rights to the quantity of water reasonably required for beneficial use and prohibits waste, unreasonable use, and unreasonable methods of use or diversion.

### Riparian Rights

A riparian right entitles the landowner to take water directly from a natural watercourse for use on lands which border or have frontage on the watercourse. However, the rights of the owner of riparian land are limited to the reasonable beneficial use of the natural flow of water which passes his land. Riparian rights pass with the title to the land, unless expressly reserved or excepted from the interests transferred, and are not gained by use or lost by mere nonuse. Although the land must be contiguous to the watercourse, the length of the frontage is not determinative of the rights; a large tract with a small frontage on a stream may be riparian to the stream, but the original grant determines the character of the land, and only the smallest contiguous tract held under a single title retains riparian rights.

A riparian owner has no right to any specified amount of the water of a stream as against other riparian owners. He has rights only to a reasonable share from the stream--a correlative right which he shares mutually with other riparian owners. In the event of insufficient water for all, the available supply must be apportioned, except that an upper riparian owner may take the whole supply if necessary for domestic use. As against appropriators, the riparian owner has the paramount right to all the water of the stream which he can put to reasonable

beneficial use, but that is the extent of his rights, and the appropriator can take the surplus.

Riparian rights do not authorize use of water on nonriparian land, nor do they permit the seasonal storage of water. Neither do they prevent temporary appropriation by others of water not presently needed for use on riparian land.

A parcel of land becomes nonriparian when severed from land bordering the stream, unless the riparian rights are reserved for the severed parcel by the grantor. Riparian rights may be destroyed when purportedly transferred apart from the land by grant, contract, or condemnation, and may be impaired or lost through prescription.

#### Overlying Rights

Owners of lands overlying a common underground water supply have the right to withdraw water for reasonable beneficial use of their overlying lands. Such overlying rights are analogous to riparian rights, in that both are based on ownership of land, and the rights of each overlying owner are mutual and correlative to the rights of all other owners. In the case of insufficient water to fully supply the requirements of all, the available supply must be equitably apportioned.

Overlying rights do not include use of water on nonoverlying land. However, surplus water not presently required for beneficial use on overlying land, and which may be withdrawn without creating an overdraft on the groundwater supply, may be appropriated for use on nonoverlying land, but the overlying rights are paramount and all appropriative rights are subject to the future requirements of overlying land.

### Appropriative Rights

An appropriation of water is any taking of water from other than riparian or overlying uses, whether such taking is from the underground by wells or from surface stream by direct diversion or storage. An appropriator, in the legal sense, is one who initially takes water without possessing rights which are based on the ownership of land. As between appropriators, the one first in this is first in right. A prior appropriator may take all the water he needs up to the full amount to which he is entitled before a later appropriator may take any.

Normally, appropriative rights are inferior to riparian rights. An exception to this is the case of an appropriation of water diverted from streams flowing through vacant public lands before the riparian lands were withdrawn from the domain of the United States. The appropriative diversions or the lands they serve may be either upstream or downstream from the riparian lands. Any water not needed for the reasonable beneficial uses of those having prior rights may properly be appropriated.

No formal or statutory procedure is or ever has been prescribed or required in this state for those who take water by means of wells from underground percolating waters or underground basins. An appropriative right to take surplus water from such sources is acquired by extracting such water from the underground and applying it to beneficial uses.

Provided the development and application to use are completed with reasonable diligence, the priority of the right as against another appropriator related back to the first substantial act toward putting the water to use or to the date of application. Until 1872, water flowing in natural streams was appropriated by taking the water.

Sections 1410 through 1422 of the Civil Code, enacted in 1872, established a permissive procedure for perfecting an appropriation of surface water. Provision was made for posting a notice of appropriation at the proposed point of diversion and recording a copy with the county recorder. If the statutory procedure were followed and the appropriation completed with due diligence, priority related back to the date of posting; otherwise, priority was established only when the water was put to beneficial use.

Since the effective date of the Water Commission Act of 1913, December 19, 1914, appropriation of surface water and water in subterranean streams flowing in known and definite channels has been by compliance with required statutory procedure. An appropriation of such water now can be made in accordance with the provisions of Part 2, Division 2 of the Water Code (Water Code Sections 1200 to 1801). An application to appropriate unappropriated water must be filed with the State Water Rights Board. If the application is approved, a permit is issued authorizing the appropriation. When the appropriation has been completed, an inspection is made and a license is issued, to the extent of beneficial use, provided the terms and conditions of the permit have been fulfilled. The priority of a permit or license relates back to the date of the appropriation.

A right to appropriate water may be lost either by abandonment or by continuous nonuse. To constitute abandonment, there must be concurrence of act and intent, wherein possession is relinquished with no intent to resume it for a beneficial use. Abandonment is, therefore, always voluntary and factual. In the case of an appropriation

initiated prior to 1914, continuous nonuse for a period of five years results in the loss of appropriative water rights. In the case of appropriative rights acquired pursuant to the Water Commission Act or the Water Code, continuous nonuse for a period of only three years may result in loss of such rights.

Where ground water and surface water are interconnected, one acting as a tributary to the other, both are treated as part of a common supply and users of water from either source are entitled to protection from substantial injury as a result of use by others of water from the other source. Thus, an owner of land riparian to a stream may have his right to the use of water protected against impairment by an appropriator of percolating ground water tributary to the stream and required for the maintenance and support of its flow. Likewise, where water from a stream percolates to a groundwater basin or stratum, the owner of land overlying the groundwater supply may be protected from an appropriation of water from the stream if this causes a substantial impairment of the groundwater supply. As between riparian use of surface water and overlying use of groundwater tributary to the stream, a sharing of the available water supply on the basis of reasonable beneficial use should be made.

#### Prescriptive Rights

It is possible to appropriate surface or groundwater which is presently needed by others to satisfy riparian, overlying, or prior appropriative rights. Such appropriations may ripen into prescriptive rights where the use is actual, open and notorious, hostile and adverse to the original owners, continuous and uninterrupted for the statutory

period of five years, made under claim of right, and with payment of taxes whenever such have been levied on the water rights. Absence of any of these essentials precludes the acquisition of prescriptive water rights.

Prescription thus requires that where the rightful owner for a period of five years, either knows or should know of the adverse taking and fails to take any physical or legal steps to interrupt such taking. An absolute right is acquired to a fixed amount of water by prescription, the quantity being determined by beneficial use, irrespective of the needs or demands of the injured riparian, overlying, or prior appropriative user. However, present use is the measure of the prescriptive right, and future needs cannot be included.

Riparian rights, overlying rights, appropriative rights, and prescriptive rights may be lost or diminished by prescription. While there is sufficient water flowing in a stream to supply the wants of all parties, the use of the water by anyone does not deprive the others of their water supply and, hence, is not an invasion of their rights. The same principle applies to a downstream diversion of water as against the rights of an upstream riparian landowner or prior appropriator. At times when the safe yield of a groundwater basin exceeds the needs of overlying landowners and appropriators, their prior rights are not invaded by a later appropriative taking of water from the underground supply. The later appropriation becomes adverse only when the groundwater basin is overdrawn; that is, when the annual draft exceeds the safe annual yield. Although neither an overlying owner nor a prior appropriator may prevent a taking of surplus water, either the owner or

the appropriator may institute legal proceedings to safeguard the supply once a surplus ceases to exist, and may enjoin any additional use beyond the point of safe yield. Since prescriptive rights can only be acquired to nonsurplus water, these rights cannot ordinarily be acquired against the future needs of riparian or overlying owners.

The prior appropriator, lower riparian, or overlying owner may protect his rights for his present needs against an adverse appropriator by actually taking the needed water before the five-year period has run, or by the aid of the courts in the form of a declaratory judgment or injunction within the five-year period.

#### Determination of Water Rights

Under provisions of the Water Code, actions involving determination of rights to the use of water brought before either state or federal courts may, at the court's discretion, be referred to the State Water Rights Board. Under provisions of Water Code Section 2000, the court may appoint the board to referee "any or all issues involved in the suit," or under Section 2001, it may limit the reference to "investigations of and report upon any or all physical facts involved". This reference procedure may be followed in suits involving either surface or groundwaters, or both.

An alternative procedure is available for adjudication of rights to the use of water of streams, lakes, and other bodies of water, but the method excludes the determination of rights to take water from an underground supply other than from a subterranean stream flowing through known and definite channels. Water Code Sections 2500 to 2900, inclusive, authorize the initiation of such proceedings.

### Litigation Concerning Local Water Rights

Water rights in the Putah-Cache Creeks Hydrographic Unit are based primarily upon appropriative or riparian status, and have frequently been the subject of controversy and litigation. Two major suits have occurred in the Cache Creek Basin. The first was "Gopcevic vs Yolo Water and Power Company" in 1920, Mendocino County Superior Court, recorded in Volume 60 of Deeds, page 49, of Lake County Official Records. The second was "Bemerly Decree" in 1940, Yolo County Superior Court Case No 8812, of Yolo County Official Records. Copies of both of these decrees are included in Appendix D.

COURT DECREES

C O P Y

IN THE SUPERIOR COURT OF THE STATE OF CALIFORNIA,  
IN AND FOR THE COUNTY OF MENDOCINO

M. M. GOPCEVIC, and THE HOTALING  
ESTATE CO., a corporation, and  
GEORGE T. RUDDICK,

Plaintiffs,

vs.

YOLO WATER AND POWER COMPANY,  
a corporation, and YOLO WATER AND  
POWER CORPORATION, a corporation,

Defendants,

COUNTY OF LAKE

and LISLE STUBBS et al,

Intervenor

DECREE

Pursuant to the stipulation of all parties herein reduced to writing  
and filed in open court on the 7th day of October, 1920, agreeing and consenting  
that the following judgment and decree be entered in the above entitled action,  
and upon evidence taken; and finding being waived in open court by all parties;

IT IS HEREBY ORDERED ADJUDGED AND DECREED AS FOLLOWS:

That the defendant herein be perpetually enjoined and restrained from  
excavating or deepening the outlet of Clear Lake, being the Clear Lake mentioned  
in the pleadings herein, to any depth greater than four feet below the zero mark  
on the Rumsey gauge at Lakeport, County of Lake, State of California, which said  
gauge is hereinafter more particularly referred to; and from widening straighten-  
ing or otherwise interfering with said outlet, except as may be necessary to

carry out the provisions of this decree, all of such work to be with the approval first obtained and under the supervision of the State Railroad Commission of California, or the members thereof; and this injunction shall include the said defendants, their and either of their, officers, agents, servants, employees successors and assigns, and each and all officers and agents of either of them, and all persons acting under or in aid of them or either of them.

That the agents, servants, employees, successors and assigns of the said defendants and the said defendants and each of them, and all persons acting under or in aid of them or either of them be perpetually enjoined and restrained from at any time, or in any way raising the level of said lake in excess of 7.56 feet above zero on said Rumsey Gauge, and from at any time or at any way lowering the level of said lake below zero on said Rumsey Gauge; provided, however, that the rise of said Clear Lake, by reason of storm or flood conditions beyond the control of said defendants, or either of them, to a level in excess of 7.56 feet above zero on said Rumsey Gauge, but in no event to a level in excess of 9.00 feet above zero on said Rumsey Gauge, for any period not exceeding ten successive days, shall not be deemed a violation hereof;

The zero mark on said Rumsey Gauge is 20.1 feet below center of large concrete star in northeast corner of court house yard at said Lakeport, and 21.56 feet below iron step at front entrance to Bank of Lake Building at southeast corner of Main Street and Second Street, in said Lakeport;

That said defendants, and each of the, their officers, agents, employees, successors and assigns and all persons acting under or in aid of them or either of them, be perpetually enjoined and restrained from drawing off from said Clear Lake an amount of water which, inclusive of evaporation and

other losses, will at any time reduce the level of said lake below zero on said Rumsey Gauge, and the said defendants, and each of them, their officers, agents, employees, successors and assigns, be perpetually enjoined and commanded to draw off from said lake an amount of water which, inclusive of evaporation and other losses will reduce the level of the lake so that the elevation thereof on the following dates shall not exceed the following percentages of the actual level on April 15th of each year;

May 1, 97%, June 1, 89%, July 1, 79%, August 1, 69% and September 1, 58%.

That said defendants and each of them, their officers, agents, employees, successors and assigns, be perpetually enjoined and restrained from drawing off from said lake, during the irrigation season an amount of water which, inclusive of evaporation and other losses shall lower the level of said lake more than two feet in any one month;

It is hereby specially adjudged and decreed that notwithstanding the limits of depression of said lake waters hereinabove described the said defendants, and each of them, their agents, employees, successors and assigns, shall not draw off or allow, and they and each of them are enjoined and restrained from drawing off or allowing the waters of said lake to flow out of said lake at any time at such a rate as that, taking into account evaporation and other losses, the water of said lake shall at the lowest level of any year be below zero on said Rumsey Gauge;

It is further adjudged and decreed that the said defendants, or either of them, shall at or about the specific dates last hereinabove mentioned, notify in writing, through the mails or otherwise, the parties hereto and as well such owners or occupants of land on the rim of said lake as shall register their names and addresses with the defendant, Yolo Water and Power Company, at its office in Woodland, Yolo County, California, of the then existing and respective levels of the said lake.

The drawing off of the water of said lake under the conditions aforesaid, shall be by and through the dam and gates mentioned in the pleadings herein, and the administration conduct and operation of said dam and gates shall be responsive to and in full and fair execution of such conditions, and shall at all times be by and under the State Railroad Commission of California, or the members thereof;

If at any time the injunctive provisions of this decree shall be violated, or departed from in matter of substance and all the provisions of this decree are for this purpose taken to be injunctive then and in such events the said defendants and each of them are hereby enjoined and commanded forthwith thereupon, in the manner and to the extent hereinafter provided, or in default thereof it shall be competent to the plaintiffs or any or either of them, or in default of action in the premises by the plaintiffs or any or either of them, it shall be competent to the interveners, or any or either of them, and said parties are accordingly hereby authorized, at the expense of defendants, their successors and assigns to restore and maintain at the "Grigsby Riffle" mentioned in the complaint herein, but above the present mouth of "Seigler Creek" a suitable and substantial structure or barrier, the crest of which shall not exceed one foot above zero on said Rumsey Gauge except as hereinafter provided;

But it is further and specifically decreed that if at any time, for any physical reason, or otherwise, said dam should cease in any substantial sense, to function in respect to the operation of the same as hereinabove referred to, then and in that event the crest of the aforesaid structure or barrier may be increased and maintained to an elevation of two feet above zero on said Rumsey Gauge, said structure and barrier shall exist and be maintained

at all times when a dam shall cease to function as provided in this decree for the operation of the same; provided however that the failure of the defendants or either of them to comply substantially with the terms of this decree, due to temporary, unavoidable causes shall not be deemed a violation of this decree;

It is further adjudged that this decree does not adjudicate upon the extent of the several riparian or littoral rights of any of the parties hereto in the said Clear Lake or the land adjacent thereto nor upon any rights or claims of any of said parties to water rights therein, nor in or over such adjacent lands, and that the injunctive relief hereby granted and provided for is not based upon a waiver by any of said parties of any such substantive rights of claims aforementioned but is subject to full reservations on the part of all and each of said parties of all said substantive rights or claims aforesaid;

It is further ordered adjudged and decreed that the said dam and the operation thereof shall at all times be subject to reasonable access and inspection by the parties hereto as well as any person owning land riparian or littoral to said Clear Lake and their duly authorized agents or attorneys; but if any question should arise in respect to the right of any such person or persons to such access and inspection, the same shall be remitted to the State Railroad Commission of California, or the members thereof for final determination.

That all claims for damages involved in this action or on account of the issuance of the temporary restraining order or preliminary injunction herein are waived and adjudged to be fully settled;

That each party to this action shall pay his own costs.

The signing and filing of this decree shall be deemed to be noticed of the terms thereof and effective as service of any injunctive process consequent thereon.

Done in open Court the 7th day of October, 1920.

A. B. McKENZIE  
Judge.

CERTIFIED:     October 7th, 1920, by the Clerk of said Court to be a full,  
true and correct copy of the original on file and of record  
in his office.

ENDORSED:     Filed October 7, 1920, HALE PRATHER, Clerk  
  by W. H. PRATHER, Deputy

RECORDED:     October 8th, 1920, in vol. 60 of Deeds, at page 49.  
Records of Lake County, California.

C.C. McDONALD,  
Attorney for Plaintiffs,  
Woodland, California.

IN THE SUPERIOR COURT OF THE STATE OF CALIFORNIA,

IN AND FOR THE COUNTY OF YOLO

MARY E. BEMMERLY and AGNES H. BEMMERLY,

Plaintiffs,

vs.

THE COUNTY OF LAKE, a Political Subdivision of the State of California, E. L. HERRICK, W. E. REICHERT, L. D. KIRKPATRICK, L. L. BURGER and J. S. REEVES, JOHN DOE DREDGING COMPANY, RICHARD DOE DREDGING COMPANY, FIRST DOE, SECOND ROE AND THIRD ROE,

Defendants.

No. 8812

J U D G M E N T

-----

This cause having been regularly called and tried by the Court, and the findings of fact and conclusions of law, and the decision thereon in writing, having been rendered, wherein judgment was ordered in favor of the plaintiffs and against the defendants hereinafter named as prayed for in the complaint and for costs,

IT IS, BY THE COURT, ORDERED, ADJUDGED AND DECREED that the defendants, The County of Lake, a Political Subdivision of the State of California, E. L. Herrick, W. E. Reichert, L. D. Kirkpatrick, L. L. Burger and J. S. Kelsay, as and comprising the Board of Supervisors of the County of Lake, State of California, the Board of Supervisors of the County of Lake, State of California, E. L. Herrick, individually and as a member of the Board of Supervisors of the County of Lake, State of California, Frank W. Noel, individually, W. E. Reichert as a member of the Board of Supervisors of the County of Lake, State of California, W. T. Smith, individually, L. D. Kirkpatrick as a member of the Board of Supervisors of the County of Lake, State of California, L. L. Burger, individually and as a member of the Board of Supervisors of the County of Lake, State of California, J. S. Kelsay, individually and as a member of the Board of Supervisors of the County of Lake, State of California, Frank B. Johnson, individually and as County Surveyor of the County of Lake, State of California, Frank W. Clark, as Director of the Department of Public Works of the State of California, and Clear Lake Water Company, a corporation, and each and all of them, and their, and each of their attorneys, agents, servants and employees and any and all persons acting under said defendants, or any of them, be, and they and each and all of them are hereby forever enjoined and restrained from in any manner widening, deepening, or enlarging the arm or slough which constitutes the outlet of the waters of and from Clear Lake into Cache Creek and from in any manner changing the said outlet so as to increase the flow of waters of and from Clear Lake into Cache Creek. The Clear Lake herein referred to is the Clear Lake described in the plaintiffs' complaint and which is located in the County of Lake, State of California.

Judgment rendered December 18, 1940.
